

Life Cycle of A Butterfly

Example:

Butterflies go through an amazing process called metamorphosis. This means they change a lot as they grow. The first stage of a butterfly's life is the egg. The butterfly mom, called a female, lays tiny eggs on a leaf. After a little while, the egg hatches, and a caterpillar comes out. This is the second stage called the larva. The caterpillar is very hungry and eats a lot. It grows bigger and bigger. Next, the caterpillar goes into the third stage, the pupa, or chrysalis. Inside the chrysalis, the caterpillar changes into a butterfly. It's like a magical transformation! Finally, the butterfly comes out of the chrysalis, and this is the fourth stage, called the adult. The butterfly is now fully grown and ready to fly. It lays eggs to start the cycle all over again.

This Informational Paragraph has:

Clear Introduction: *It begins with a clear and simple introduction that explains what the paragraph is about - the life cycle of a butterfly.*

Logical Organization: *The paragraph follows a logical sequence, going through the stages of the butterfly's life cycle in order, from the egg to the adult.*

Factual Information: *The paragraph provides accurate facts and details about the life cycle, using easy to understand sentences.*

Transition Words: *It uses words like "next" and "finally" to signal the order of events, which helps with organization.*

Conclusion : *A strong concluding sentence that ties to the final stage and lets you know the cycle repeats which is what the cycle is all about.*
